

1 At start of day, scan all events in GUI selected sports by wagerType. Note that we can not make a decision of what is suitable for betting as the odds will change during the day as the match start time approaches.
2 Calculate MinutesToStart for each event
3 TotalFunds = AccountBalance + Sum(Funds committed on all wagers)
4 Max funds that can be used on any one wager are set by the variables GV_BackLay_MaxFundsPercentage, GV_BackDutch_MaxFundsPercentage & GV_LTD_MaxFundsPercentage.
5 We also use ReservedAllocations for each wager type to ensure we generally have funds available via the variables GV_BackLay_ReservedFundsPercentage, GV_BackLay_ReservedFundsPercentage, GV_BackDutch_ReservedFundsPercentage & GV_LTD_ReservedFundsPercentage.
6 Note tht the reserved funds percentages may total to less than 100%
7 We expect that the BackLay bets will generate the most turnover, as each event duration, from start of first wager to completion is typically no more than 10 minutes (races generally start later than scheduled start time). This is followed by the BckDutch, since BEfair releases funds back to the account when both back bets are matched.
